## Data sheet

-  - Size  
8 ... 32
-  - Stroke length  
8 ... 60 mm

**General technical data**

Size	8	12	16	20	25	32
Stroke [mm]	8	12	20	25	40	60
Mode of operation	Hydraulic shock absorber with spring return Single-acting, pushing					
Cushioning	Adjustable, force-dependent, hard characteristic curve					
Cushioning length [mm]	8	12	20	25	40	60
Type of mounting	With lock nut					
Impact velocity [m/s]	0.1 ... 3					
Mounting position	Any					
Product weight [g]	60	105/120 <sup>1)</sup>	200/250 <sup>1)</sup>	355/425 <sup>1)</sup>	715	1355
Ambient temperature [°C]	-10 ... +80					
Corrosion resistance class CRC <sup>2)</sup>	2					

1) Applies to shock absorbers with special thread T

2) Corrosion resistance class CRC 2 to Festo standard FN 940070

Moderate corrosion stress. Indoor applications in which condensation can occur. External visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment.

**Reset time [s]**

Size	8	12	16	20	25	32
Reset time <sup>1)</sup>	≤ 0.2		≤ 0.3		≤ 0.4	≤ 0.6

1) The specified technical data refers to room temperature. At -10°C, the reset time can be up to 1 s for sizes 12 and 16, and up to 3 s for sizes 8, 20, 25 and 32.

**Forces [N]**

Size	8	12	16	20	25	32
Min. insertion force <sup>1)</sup>	18	38	66	110	155	175
Max. stop force <sup>2)</sup> in the end positions	400	900	1600	2500	4000	6400
Min. resetting force <sup>3)</sup>	1.8	4.5	5.4	9	12.5	18

1) This is the minimum force that must be applied so that the shock absorber is pushed precisely into the retracted end position. This value is reduced accordingly with an extended external end position.

2) If the maximum stop force is exceeded, a fixed stop (e.g. YSRA) must be fitted 0.5 mm before the end of stroke.

3) This is the maximum force that can act on the piston rod, allowing the shock absorber to fully extend (e.g. extended stud).

**Energies [J]**

Size	8	12	16	20	25	32
Max. energy absorption per stroke	4	10.8	32	62.5	160	384
Max. energy consumption per hour	24000	60000	100000	135000	220000	330000
Max. residual energy	0.01	0.05	0.16	0.32	0.8	2

Data sheet

## Data sheet

-  - Size  
 4 ... 32
-  - Stroke length  
 4 ... 60 mm

**General technical data**

Size	4	5	7	8	10	12	16	20	25	32
Stroke [mm]	4	5	5	8	10	12	20	25	40	60
Mode of operation	Hydraulic shock absorber with spring return									
	Single-acting, pushing									
Cushioning	Self-adjusting, hard characteristic curve									
Cushioning length [mm]	4	5	5	8	10	12	20	25	40	60
Type of mounting	With lock nut									
Impact velocity [m/s]	0.05 ... 2		0.05 ... 3							
Mounting position	Any									
Product weight [g]	5	8	16	32	51	74	185	318	600	1220
Ambient temperature [°C]	-10 ... +80									
Corrosion resistance class CRC <sup>1)</sup>	2									

1) Corrosion resistance class CRC 2 to Festo standard FN 940070

Moderate corrosion stress. Indoor applications in which condensation can occur. External visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment.

**Reset time [s]**

Size	4	5	7	8	10	12	16	20	25	32	
Reset time <sup>1)</sup>	≤ 0.2						≤ 0.3		≤ 0.4	≤ 0.5	

1) The specified technical data refers to room temperature. At higher temperatures in the region of 80°C, the maximum mass and the cushioning energy must be reduced by approximately 50%. At -10°C, the reset time may be up to 1 second.

**Forces [N]**

Size	4	5	7	8	10	12	16	20	25	32
Min. insertion force <sup>1)</sup>	6.5	7.5	10	18	25	35	60	100	140	160
Max. stop force <sup>2)</sup> in the end positions	100	200	300	500	700	1000	2000	3000	4000	6000
Min. resetting force <sup>3)</sup>	0.7	0.9	1.2	2.5	3.5	5	6	10	14	20

1) This is the minimum force that must be applied so that the shock absorber is pushed precisely into the retracted end position. This value is reduced accordingly with an extended external end position.

2) If the maximum stop force is exceeded, a fixed stop (e.g. YSRA) must be fitted 0.5 mm before the end of stroke.

3) This is the maximum force that can act on the piston rod, allowing the shock absorber to fully extend (e.g. extended stud).

**Energies [J]**

Size	4	5	7	8	10	12	16	20	25	32
Max. energy absorption per stroke	0.6	1	2	3	6	10	30	60	160	380
Max. energy consumption per hour	5600	8000	12000	18000	26000	36000	64000	92000	150000	220000
Max. residual energy	0.006	0.01		0.02	0.03	0.05	0.16	0.32	0.8	2

**Mass range [kg]**

Size	4	5	7	8	10	12	16	20	25	32
Mass range up to	1.2	1.5	5	15	25	45	90	120	200	400

## Data sheet

### Materials

Size	4	5	7	8	10	12	16	20	25	32

## Data sheet

- $\varnothing$  - Size  
5 ... 20
- | - Stroke length  
8 ... 34 mm

General technical data								
Size		5	7	8	10	12	16	20
Stroke	[mm]	8	10	14	17	20	26	34
Mode of operation		Hydraulic shock absorber with spring return						
		Single-acting, pushing						
Cushioning		Self-adjusting, soft characteristic curve						
Cushioning length	[mm]	8	10	14	17	20	26	34
Type of mounting		With lock nut						
Impact velocity	[m/s]	0.1 ... 2	0.1 ... 3					
Mounting position		Any						
Product weight	[g]	8	18	34	54	78	190	330
Ambient temperature	[°C]	-10 ... +80						
Corrosion resistance class CRC <sup>1)</sup>		2						

1) Corrosion resistance class CRC 2 to Festo standard FN 940070

Moderate corrosion stress. Indoor applications in which condensation can occur. External visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment.

Reset time [s]								
Size		5	7	8	10	12	16	20
Reset time <sup>1)</sup>		≤ 0.2				≤ 0.3		

1) The specified technical data refers to room temperature. At higher temperatures in the region of 80°C, the maximum mass and the cushioning energy must be reduced by approximately 50%. At -10°C, the reset time may be up to 1 second.

Forces [N]								
Size		5	7	8	10	12	16	20
Min. insertion force <sup>1)</sup>		7.5	10	18	25	35	60	100
Max. stop force <sup>2)</sup> in the end positions		200	300	500	700	1000	2000	3000
Min. resetting force <sup>3)</sup>		0.9	1.2	2.5	3.5	5	6	10

1) This is the minimum force that must be applied so that the shock absorber is pushed precisely into the retracted end position. This value is reduced accordingly with an extended external end position.

2) If the maximum stop force is exceeded, a fixed stop (e.g. YSRA) must be fitted 0.5 mm before the end of stroke.

3) This is the maximum force that can act on the piston rod, allowing the shock absorber to fully extend (e.g. extended stud).

Energies [J]								
Size		5	7	8	10	12	16	20
Max. energy absorption per stroke		1.3	2.5	4	8	12	35	70
Max. energy consumption per hour		10000	15000	21000	30000	41000	68000	100000
Max. residual energy		0.01		0.02	0.03	0.05	0.16	0.32

Mass range [kg]								
Size		5	7	8	10	12	16	20
Mass range up to		2	5	10	20	30	50	80

## Data sheet

-  - Size  
2 ... 12
-  - Stroke length  
4 ... 12 mm

General technical data										
Size		2	3	4	5	7	8	10	12	
Stroke	[mm]	4	4	4	5	5	8	10	12	
Mode of operation		Hydraulic shock absorber with spring return								
		Single-acting, pushing								
Cushioning		Self-adjusting, soft characteristic curve								
Cushioning length	[mm]	4	4	4	5	5	8	10	12	
Type of mounting		With lock nut								
Impact velocity	[m/s]	0.1 ... 0.5	0.1 ... 1			0.1 ... 1.5				
Mounting position		Any								
Product weight <sup>1)</sup>	[g]	1	3	4.5	7	15	30	51	82	
Ambient temperature	[°C]	-10 ... +70		-10 ... +80				-5 ... +80		
Corrosion resistance class CRC <sup>2)</sup>		2								

1) Weight without nut.

2) Corrosion resistance class CRC 2 to Festo standard FN 940070

Moderate corrosion stress. Indoor applications in which condensation can occur. External visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment.

Reset time [s]									
Size		2	3	4	5	7	8	10	12
Reset time <sup>1)</sup>		≤ 0.5	≤ 0.2						

1) The specified technical data refers to room temperature. At higher temperatures in the region of 80°C, the maximum mass and the cushioning energy must be reduced by approximately 50%. At -10°C, the reset time may be up to 1 second.

Increased reset times must be expected with longer dwell time in the end position.

Forces [N]									
Size		2	3	4	5	7	8	10	12
Min. insertion force <sup>1)</sup>		2.5	3.5	4.5	10	10	18	24	35
Max. stop force <sup>2)</sup> in end positions (housing)		60	80	100	200	300	500	700	1000
Min. resetting force <sup>3)</sup>		0.8	0.5	0.8	0.9	1.2	2.5	4	4

1) This is the minimum force that must be applied so that the shock absorber is pushed precisely into the retracted end position. This value is reduced accordingly with an extended external end position.

2) If the maximum stop force is exceeded, a fixed stop (e.g. YSRA) must be fitted 0.5 mm before the end of stroke.

3) This is the maximum force that can act on the piston rod, allowing the shock absorber to fully extend (e.g. extended stud).

Energies									
Size		2	3	4	5	7	8	10	12
Max. energy absorption per stroke at +20°C	[J]	0.1	0.4	0.8	1.4	2	3	6	10
Max. energy absorption per hour at +20°C	[kJ]	0.27	4.5	5.5	8	12	18	25	36
Max. operating frequency <sup>1)</sup>	[Cycles/min]	50	80	80	80	70	50	50	50
Max. residual energy		0.003	0.004	0.006	0.01	0.01	0.02	0.03	0.05

1) For energy utilisation of 70% or above per stroke.

## Data sheet

-  - Size  
5 ... 8
-  - Stroke length  
7.5 ... 13.5 mm

General technical data			
Size		5	7   8
Stroke	[mm]	8	10   14
Mode of operation	A piston rod in front of the shock absorber transfers the force to the shock absorber. The piston rod acts as an end stop and actuates the proximity switch via a magnet mounted on it		
	Single-acting, pushing		
Cushioning	Self-adjusting, soft characteristic curve		
Cushioning length	[mm]	8	10   14
Type of mounting	With lock nut		
Position sensing	Via proximity switch		
Impact velocity	[m/s]	0.05 ... 2	0.05 ... 3
Repetition accuracy	[mm]	0.02	
Mounting position	Any		
Product weight	[g]	45	75   110
Ambient temperature	[°C]	0 ... +60	
Corrosion resistance class CRC <sup>1)</sup>	2		

1) Corrosion resistance class CRC 2 to Festo standard FN 940070

Moderate corrosion stress. Indoor applications in which condensation can occur. External visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment.

Reset time [s]			
Size		5	7   8
Reset time <sup>1)</sup>		≤ 0.2	

1) The specified technical data refers to room temperature. At higher temperatures in the region of 80°C, the maximum mass and the cushioning energy must be reduced by approximately 50%. At 0°C, the reset time may be up to 1 second.

Forces [N]			
Size		5	7   8
Min. insertion force <sup>1)</sup>		5	18   80
Max. stop force <sup>2)</sup> in the end positions		200	300   500
Min. resetting force <sup>3)</sup>		1.5	2   3.5

1) This is the minimum force that must be applied so that the shock absorber is pushed precisely into the retracted end position.

2) The max. stop force must not be exceeded.

3) This is the maximum force that can act on the piston rod, allowing the shock absorber to fully extend.

Energies [J]			
Size		5	7   8
Max. energy absorption per stroke		1	2   3
Max. energy consumption per hour		10000	15000   21000
Max. residual energy		0.01	0.02

Mass range [kg]			
Size		5	7   8
Mass range up to		2	5   10

## Data sheet

### Materials

Stop element	
Limit plunger	Reinforced stainless steel
Stop sleeve	Galvanised steel
Threaded barrel	Nickel-plated brass
Note on materials	RoHS-compliant

## Data sheet

-  - Size  
 16 ... 32
-  - Stroke length  
 20 ... 60 mm

General technical data							
Size		16		20		25	32
Stroke	[mm]	20	40	25	50	40	60
Mode of operation		Hydraulic cushioning cylinder with spring return Single-acting, pushing					
Braking speed		Adjustable					
Type of mounting		With lock nut					
Max. impact velocity	[m/s]	0.3					
Mounting position		Any					
Feed speed	[mm/s]	0.2 ... 100					
Product weight	[g]	190	255	360	440	720	1380
Ambient temperature	[°C]	0 ... +80					
Corrosion resistance class CRC <sup>1)</sup>		1					

1) Corrosion resistance class CRC 1 to Festo standard FN 940070

Low corrosion stress. Dry indoor application or transport and storage protection. Also applies to parts behind covers, in the non-visible interior area, and parts which are covered in the application (e.g. drive trunnions).

Reset times [s]						
Size		16		20	25	32
Short stroke <sup>1)</sup>		≤ 0.4		≤ 0.5	≤ 0.8	≤ 1.2
Long stroke <sup>1)</sup>		≤ 0.8		≤ 1	-	-

1) Increased reset times must be expected at low temperatures (0°C). Up to 5 s for sizes 12 and 16, and up to 12 s for sizes 25 and 32.

Forces [N]						
Size		16		20	25	32
Min. feed force <sup>1)</sup>		160		250	400	640
Max. feed force <sup>2)</sup>		1600		2500	4000	6400
Resetting force <sup>3)</sup>		5.4		9	12.5	18

1) Minimum force required for constant and accurately reproducible braking speed

2) Corresponds to max. force in the end position

3) With piston rod extended

Energies [J]							
Size		16		20		25	32
Stroke	[mm]	20	40	25	50	40	60

## Data sheet

This selection aid helps you determine the right shock absorber for every application.

When choosing the correct shock absorber, we recommend that you proceed as follows:

When selecting a shock absorber for your application, you must ensure that the following values are not exceeded:

The (angular) speed used in the formulas is the speed on impact with the shock absorber. This depends on the dynamic performance of the drive component and can thus only be determined with difficulty.

It is better to determine the average speed ( $v_m = s/t$  or  $\omega_m = \varphi/t$ ).

The following formulas are required for the calculation:

The following applies in addition for rotary motion:

The following abbreviations are used:

1. Determine the following at the moment of impact:

- Force (A)
- Equivalent mass  $m_{equiv}$
- Impact velocity (v)

- Permissible energy utilisation per stroke:

$$W_{min.} = 25\%$$

$$W_{max.} = 100\%$$

- Recommended energy utilisation per stroke:

$$W_{opt.} = 50\% \dots 100\%$$

To prevent damage to the drive, for safety reasons the following values should be used for calculation:

$$v = 1.25 \dots 2 v_m$$

$$\omega = 1.25 \dots 2 \omega_m$$

Typical values for linear movements:

Factor of 2 for strokes < 50 mm,

Factor of 1.5 for strokes > 50 mm and < 100 mm,

Factor of 1.25 for strokes > 100 mm.

$$A = F + G$$

$$A = F + m \times g \times \sin \alpha$$

$$W_{total} = 1/2 \times m \times v^2 + A \times s < W_{max.}$$

$$W_h = W_{total} \times \text{strokes} / \text{hour} < W_{hmax.}$$

$$m_{equiv.} = 1/R^2$$

$$v = w \times R$$

$$A = M/R + m \times g \times \sin \alpha \times a/R$$

A = Additional force = F + G [N]

F = Cylinder force minus frictional force [N]

G = Weight force  
=  $m \times g \times \sin \alpha$

Special cases:

$\alpha = 0^\circ$ : Horizontal movement  
G = 0

$\alpha = 90^\circ$ : Downward movement  
G =  $m \times g$

$\alpha = 90^\circ$ : Upward movement  
G =  $-m \times g$

2. Select the shock absorber from the graphs on the following pages.

3. Check the selected shock absorber using the max. cushioning energy ( $W_{max.}$ )

- Max. energy absorption per hour

- Max. residual energy

- Max. stop force in the end position

As the (angular) speed is squared in the calculation, the expected error increases considerably. The calculation can therefore only be taken into consideration as an approximate figure. However, the safety factor ensures that it is not possible to select a shock absorber that is too small.

v = Impact velocity [m/s]

$m_{equiv.}$  = Equivalent mass [kg]

g = Acceleration due to gravity  
9.81 [m/s<sup>2</sup>]

s = Shock absorber stroke [m]

$\alpha$  = Impact angle [°]

$W_{total}$  = Cushioning work/stroke [J]

$W_h$  = Cushioning work/hour [J]

J = Mass moment of inertia  
[kg x m<sup>2</sup>]

R = Distance between the pivot point of mass and shock absorber [m]

$\omega$  = Angular speed [rad/s]

M = Drive torque [Nm]

a = Distance between the centre of gravity of mass and the pivot point

## Data sheet

### Sizing example for linear motion

The procedure for selecting a shock absorber is illustrated using the adjacent diagram as an example:

$$A = F + m \times g \times \sin \alpha$$

$$= 190 \text{ N} + 50 \times 9.81 \times \sin \alpha$$

$$= 537 \text{ N}$$

$$m_{\text{equiv.}} = m = 50 \text{ kg}$$

$$m = 50 \text{ kg}$$

$$v = 1.5 \text{ m/s}$$

$$\alpha = 45^\circ$$

$$F = 190 \text{ N}$$

( $\varnothing$  20 mm for  $p = 6 \text{ bar}$ ,  
1800 strokes per hour)

When selecting the shock absorbers from the graphs (see data sheets), the curve immediately to the right of the point of intersection of the equivalent mass ( $m_{\text{equiv.}}$ ) and the impact velocity ( $v$ ) determines the force ( $A$ ). The curves move to the left as the additional force increases.

Three force curves are shown for each shock absorber. An average must be taken for intermediate values. As the graphs show (solid line), shock absorbers DYSR-25-40 and YSR-25-40-C can be considered here.

It is yet to be determined whether the permissible cushioning work ( $W_{\text{max.}}$ ) and the cushioning work per hour ( $W_{\text{hmax.}}$ ) have been exceeded. The max. permissible values and the stroke length ( $s$ ) can be found in the tables (below the graphs).

Test:

$$W_{\text{total}} = 1/2 \times m \times v^2 + A \times s$$

$$= (1/2 \times 50 \times 1.5^2 + 537 \times 0.04) \text{ Nm} = 78 \text{ J}$$

$$W_{\text{h}} = W_{\text{total}} \times \text{strokes/h}$$

$$= 78 \text{ Nm} \times 1800$$

$$= 140000 \text{ J}$$

Both shock absorbers are suitable for the above application. Additional selection criteria include possibility of adjustment, and size.

Result	DYSR-25-40	YSR-25-40-C
$W_{\text{total}}$	78 J	78 J
$W_{\text{h}}$	140000 J	140000 J
$W_{\text{max.}}^{1)}$	$160 \text{ J} > W_{\text{total}}$	$160 \text{ J} > W_{\text{total}}$
$W_{\text{hmax.}}$	$220000 > W_{\text{max.}}$	$150000 > W_{\text{max.}}$

1) In both cases, utilisation is 49%.

## Data sheet

## Sizing example for rotary motion

Example for rotary motion:

$$m_{\text{equiv.}} = J/R^2 = 8 \text{ kg}$$

$$v = \omega \times R$$

$$A = M/R = 40 \text{ N}$$

$$J = 2 \text{ kg m}^2$$

$$\omega = 4 \text{ rad/s}$$

$$R = 0.5 \text{ m}$$

$$M = 20 \text{ Nm}$$

900 strokes per hour

When selecting the shock absorbers from the graphs (see data sheets), the curve immediately to the right of the point of intersection of the equivalent mass ( $m_{\text{equiv.}}$ ) and the impact velocity ( $v$ ) determines the force ( $A$ ). The curves move to the left as the additional force increases. Three force curves are shown for each shock absorber. An average must be taken for intermediate values. As the graphs show (dashed line), shock absorbers DYSR-16-20 and YSR-16-20-C are can be considered.

It is yet to be determined whether the permissible cushioning work ( $W_{\text{max.}}$ ) and the cushioning work per hour ( $W_{\text{hmax.}}$ ) have been exceeded. The max. permissible values and the stroke length ( $s$ ) can be found in the tables (below the graphs).

Comment: For rotary applications, the impact angle must be taken into account.

Test:

$$\begin{aligned} W_{\text{total}} &= 1/2 \times m \times v^2 + A \times s \\ &= (1/2 \times 8 \times 2^2 + \\ &\quad 40 \times 0.02) \text{ J} = 17 \text{ J} \end{aligned}$$

$$\begin{aligned} W_{\text{h}} &= W_{\text{total}} \times \text{strokes/h} \\ &= 17 \text{ J} \times 900 \\ &= 15\,300 \text{ J} \end{aligned}$$

Both shock absorbers are suitable for the above application.

Additional selection criteria include possibility of adjustment, and size.

Result	DYSR-16-20 <sup>3)</sup>	YSR-16-20-C
$W_{\text{total}}$	17 J	17 J
$W_{\text{h}}$	15 300 J	15 300 J
$W_{\text{max.}}$	32 J > $W_{\text{total}}$ <sup>1)</sup>	30 J > $W_{\text{total}}$ <sup>2)</sup>
$W_{\text{hmax.}}$	100000 > $W_{\text{max.}}$	64000 > $W_{\text{max.}}$

- 1) Utilisation is 53%.
- 2) Utilisation is 57%.
- 3) Operated without buffer.
